Experience

Software Engineer Feb 2025-current
PeakSpan Capital (Intern → Full-time) *On-site*

- Built 'Anna,' an agentic research assistant (LangGraph) for the investment team. Answers plain-language questions across structured sources (financials, competitor data) and unstructured ones (Salesforce Chatter, Fathom call transcripts, investment memos), so analysts stop chasing answers across systems. Saves the team roughly 10 hours a week.
- Moved a $500k+$ query/month classification workload off a commercial LLM API: fine-tuned Mistral-7B and served it with vLLM on spare on-prem GPUs. Matched the prior OpenAI model's accuracy, cut the recurring API cost to zero, and kept proprietary data in-house.
- Drove the migration decision with a custom evaluation harness that scored both models against ground-truth labels.
- Stood up an MCP server exposing the firm's internal knowledge (Masterclass transcripts, Expert Community member bios and work histories) as a semantic search endpoint over a vector store; analysts and agents query it in natural language.
- Built a ranking model that scores the firm's 'Ideal Investment Profile' across $2M+$ companies using historical deal data and partner heuristics. Surfaces 95% of high-priority targets in the top 15% of results; the team now sources from a ranked list instead of a raw universe.
- Advised a portfolio company working down its burn on cost-efficient data collection and LLM processing, then helped ship the internal tooling that replaced a $300k/year third-party service.

Data Engineer Intern June 2024 - September 2024
Driftwood Heritage Holdings *Remote*

- Built a scraping service (FastAPI on AWS Elastic Beanstalk) that pairs Selenium with GPT vision to turn screenshots into structured database records, replacing a third-party vendor.
- Automated lead-acquisition workflows, cutting collection time from 5–10 minutes per task to about one; saved roughly 30 hours of manual work per week.
- Built the pipeline syncing scraped records into Airtable in real time.

Prompt Engineer Feb 2024 - June 2024
Scale AI *Remote*

- Wrote RLHF training and evaluation data for generative models: SQL queries, test cases, mathematical proofs, and model-fitting problems.
- Tested and refined the chain-of-thought reasoning used in OpenAI's o1 and o3 model series.

Education

Boston College Chestnut Hill, MA
Mathematics B.A., Computer Science B.A. *Aug. 2021 – May 2025*

- Relevant courses: Statistics, Machine Learning, Deep Learning, Computer Vision, Linear Algebra, Differential Equations, Differential Geometry, Large Scale Data Processing

The Browning School New York, NY
High School; Graduated Cum Laude *Aug. 2017 – May 2021*

- SAT: 1510
